Loading model on the server
(loadModel method as Server)

Parse model XML, filter out
non-portable classes

Find remote sinks, sources
and attributes
Currently they must be added
to the model file but in the
future this info should be
loaded from the UI file.

Perform type resolution and
capture type information on
all remote sinks, sources, and
attributes

Replace sinks and sources
with proxies, set up remote
attribute listeners

set up infrastructure

Loading model on the client
(loadModel method)

Parse layout XML, filter out
non-portable classes

Find remote sinks, sources
and attributes.

Assign type information to all
sinks and sources that were
marked as _remote
TODO: the same must apply
to the remote attribute

Set up remote attributes

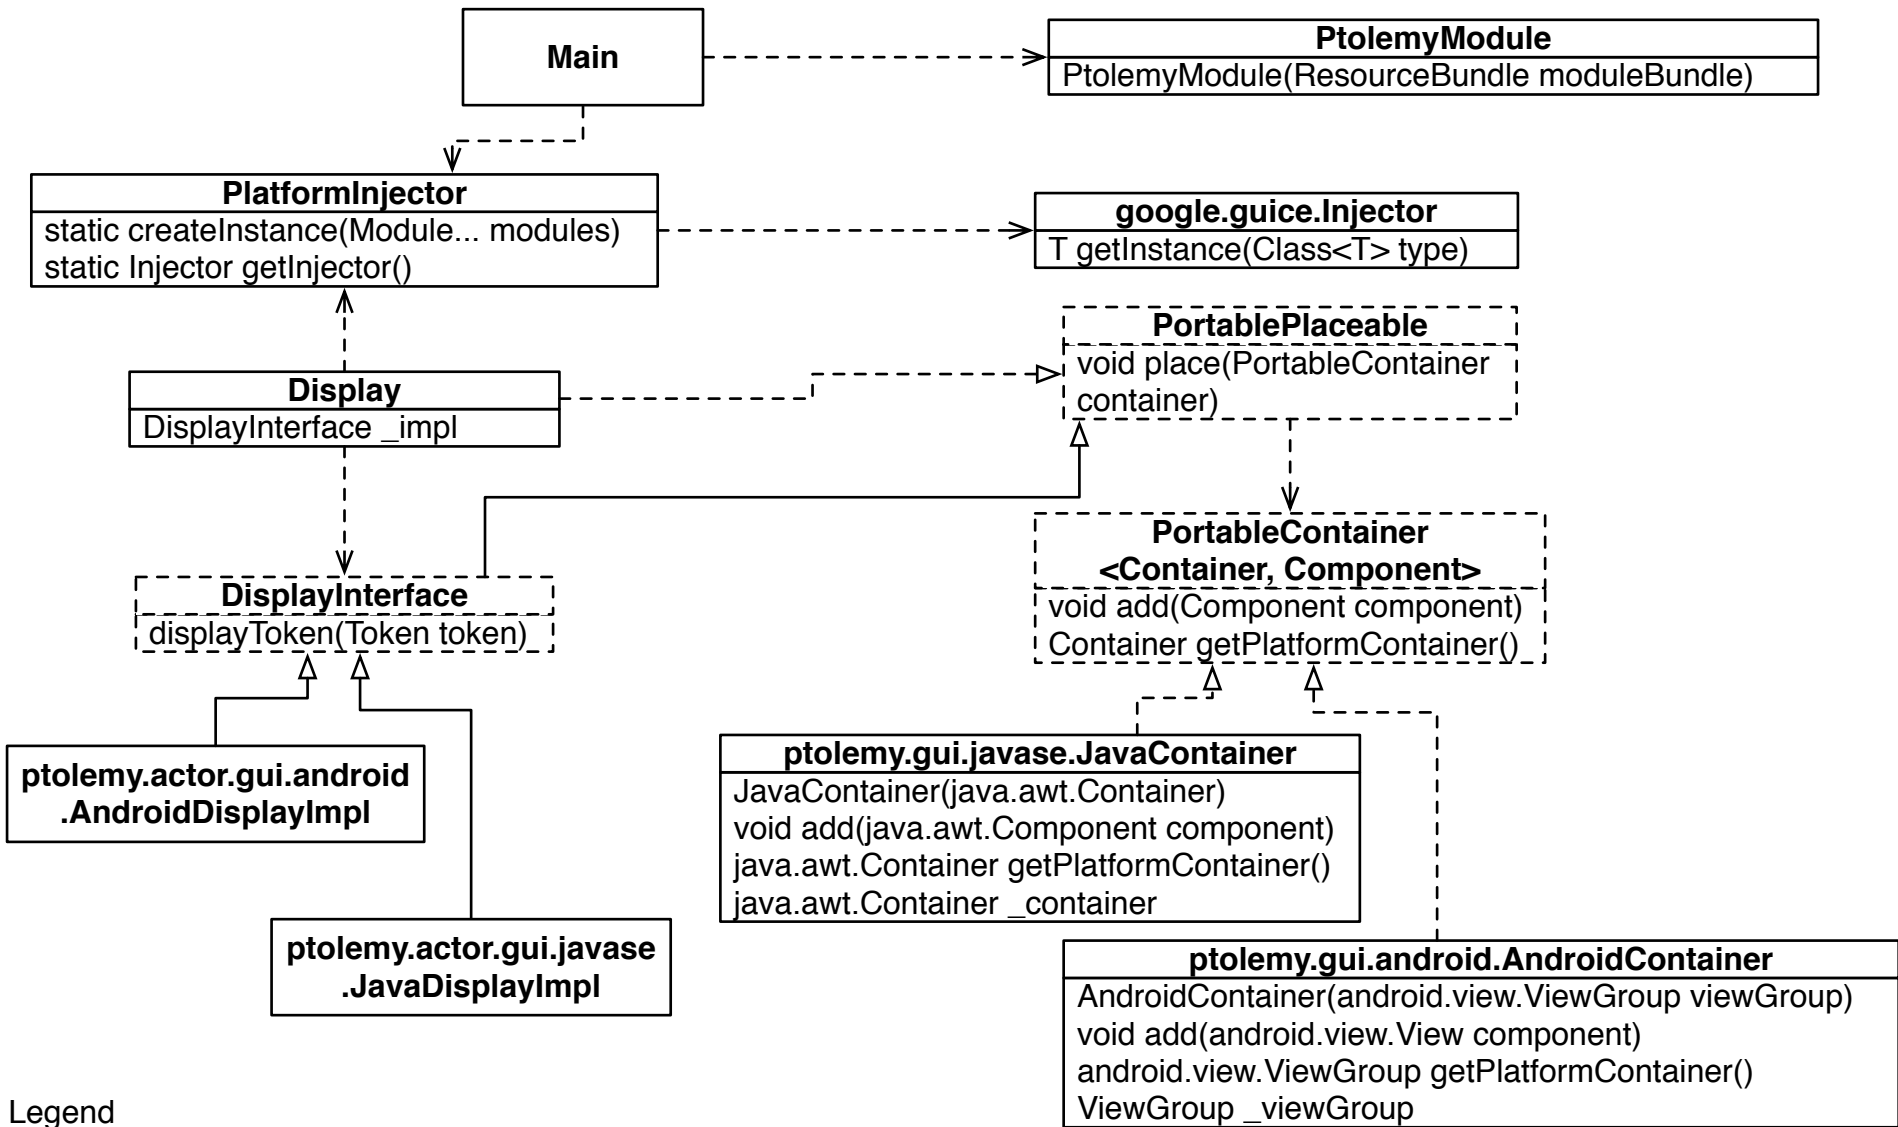

Generating layout file
(loadModel method as Client)

Parse layout XML, filter out
non-portable classes

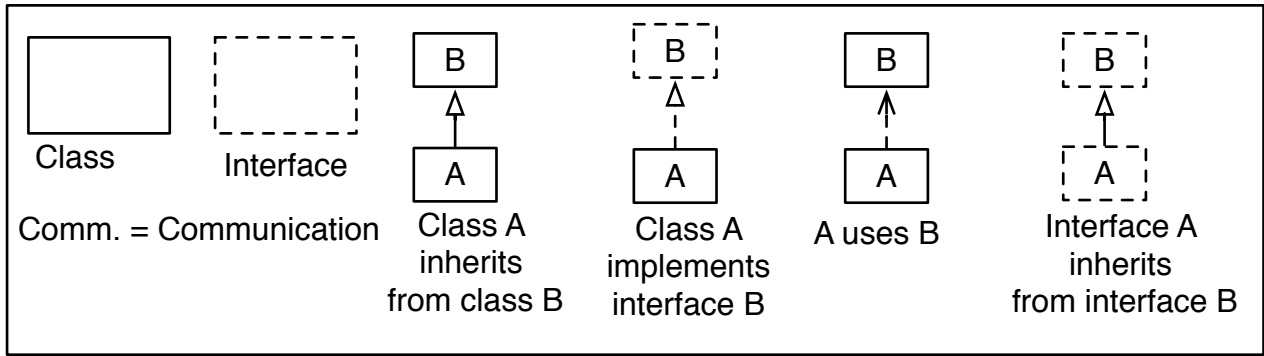

Find remote sinks, sources
and attributes
Currently they must be added
to the model file but in the
future this info should be
loaded from the UI file.

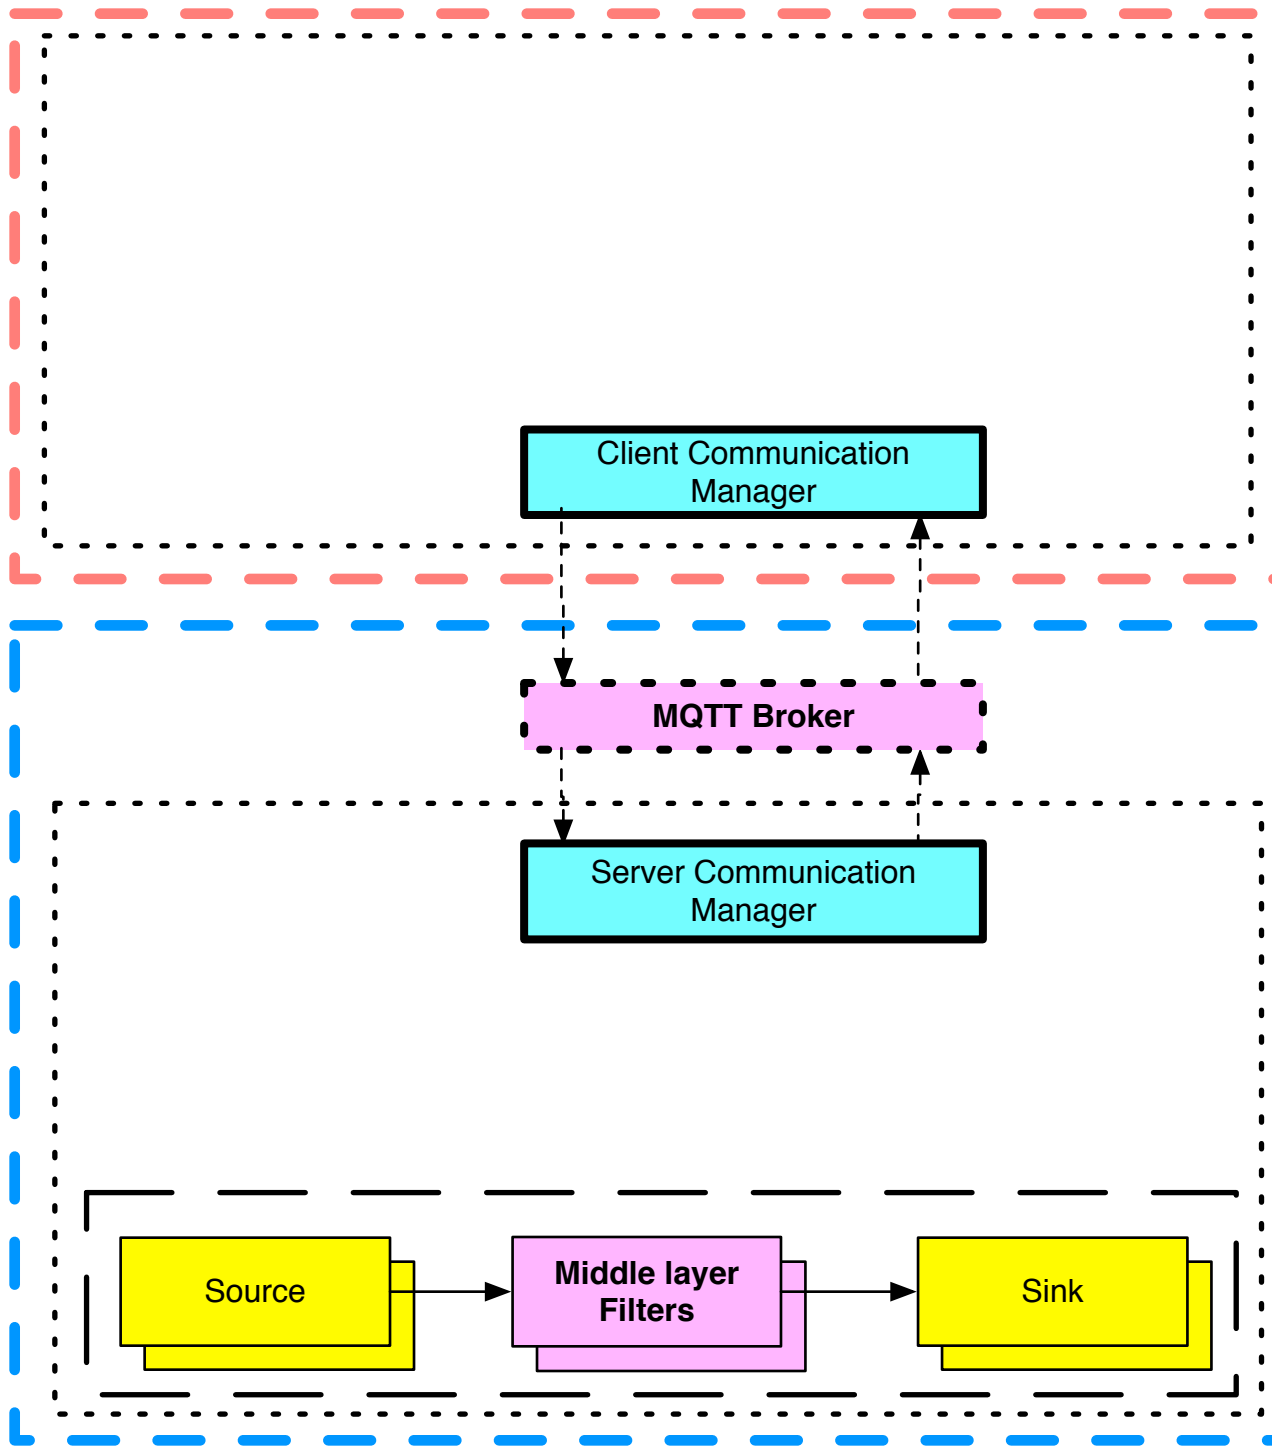

Replace actors connected to
sinks and sources with
proxies, set up remote
attribute listeners, remove
other actors

Copy port of the target
actor to the connected
remote actor; flip its
input/output fields.
Copy target actors
attributes.
